

1. Introduction

Lead Posting Specifications

This document will explain the posting method, provide sample requests, sample responses, and the sample code to help you with posting. This information is subject to change without notice. This document contains confidential and proprietary business information and is only distributed in accordance with a signed confidentiality agreement. Any use or distribution not expressly allowed by the confidentiality agreement is strictly prohibited.

2. Overview

Method: Phonexa accepts leads through the HTTP POST process. Lead generators are asked to send leads via HTTP POST to the URL specified in the Leads Specs section.

Format/Data Type: JSON or FORM

Fields: Phonexa API contains both required and optional fields. Phonexa will not accept a lead when any of the required fields are omitted, or the value of those fields is null or blank. Phonexa also has some specific formatting for particular fields. If the formatting is incorrect, the lead will be rejected. Data can be sent in the request in any order, but **all of the field names are case sensitive and must match examples in the specifications**, including capitalization (e.g., cApiTaLiZaTiOn).

Testing: To enable the test mode, add the **testMode=1** parameter in the request. You can use the live credentials for testing. When sending leads in the test mode, Phonexa will provide valid responses to help you with the integration set up process. Responses will indicate the status of the lead as well as possible errors. Test leads must contain data similar to real leads, and you can send as many test leads as needed. Make sure you remove the **testMode=1** parameter once you are done testing to start sending live leads.

Ping/Post Method: The Ping/Post method allows lead generators to ping the system with partial lead data first and get a response from the system before submitting the full data. Use the PING + POST strategy to submit a ping first to get a response from the system and then, based on the response, post the full lead data. You can also use the Full Post strategy to post the full lead data in one request. Please note that Phonexa will still process the request as a ping and a post when using the Full Post strategy.

3. Auto Insurance Ping Post Leads Specs

Use either **PING + POST strategy**, or **Full Post** strategy

6. The Intermittent Lead Status Query

This method reduces the consumption of resources when processing leads and increases stability by eliminating the need to maintain uninterrupted connection between servers for an extended period of time.

Method pros:

- Reduces reliance on prolonged connection which is especially valuable in mobile apps (background processing) and cases of low-quality internet connection.
- Decreases the common load on the system due to reduced connection time between client and server.
- Retrieval of lead status may become available even after processing is complete and the client has abandoned the page. In this case a redirect link may be provided to the client through another channel (ex: push notification, SMS, email).

Implementing this method results in an increase of successful redirects as well as improved traffic quality.

General work algorithm:

- Add parameter closeConnection=1 with the rest of the lead parameters. After the system receives data, the connection will be closed but the lead will be processed in the background. In the JSON response, you will receive the "lead_id" parameter.
- System will send an intermittent query per specified time intervals to get lead result using the following request:
https://leads.inst338.client.phonexa.com/lead/check-lead-status?apiId={apiId}&apiPassword={apiPassword}&checkKey={lead_id}.

Recommended incremental ping time intervals:

- 0-10 seconds: query every second since the majority of sold leads have a status within the first 10 seconds.
- 11-30 seconds: intermittent queries can be made every 2 seconds.
- 31-60 seconds: query frequency reduced to once every 3 seconds.
- 61 seconds and above: query frequency can further be reduced down to once every 5 seconds to maintain efficiency of the processing method.
- Set a maximum processing time limit (ex: 300 seconds). If lead surpasses threshold, then the lead has not sold.

Response examples:

6.1 Sold

```
{
    "status": 1,
    "status_text": "sold",
    "redirect_url": "https://leads.system.com/redirect?id=81649f87d4e596a711d449970392ed67"

7. Test Mode

For testing Reject, please use the same live credentials but add **testMode=1** in parameter list.

For testing Sold, use the same live credentials but add **testMode=1** and **testSold=1** in parameter list.

WARNING: make sure to remove it once you are done testing and start sending live leads.
